Example: Quicksort

```
algorithm quicksort(A:List Int, lo:Int, hi:Int) {
   p := partition(A, lo, hi)
   quicksort(A, lo, p)
   quicksort(A, p + 1, hi)
}
```

```
algorithm partition(A:List Int, lo:Int, hi:Int) {
    mid = (lo + hi) / 2
   pivot := A[mid]
   …
}
```

Example: Quicksort

Problems:

- What if lo or hi is negative?
- What if hi < lo?
- What if the size of the list is 0?
